

Driscoll Health Plan Medical Necessity Guideline

Medical Necessity Guideline: Physical or Occupational Therapy for Carpal Tunnel Syndrome (CPS)	Creation Date: 02/19/2016	Review Date: 05/24/2024	Effective Date: 06/11/2024
---	-------------------------------------	-----------------------------------	--------------------------------------

PURPOSE:

To detail the indications and appropriate therapeutic treatment for Carpal Tunnel Syndrome (CTS).

LINE OF BUSINESS: STAR, STAR Kids, and CHIP

DEFINITIONS:

Carpal tunnel syndrome - a common condition that causes pain, numbness, and tingling in the hand and arm. The condition occurs when one of the major nerves to the hand – the median nerve – is squeezed or compressed as it travels through the wrist. ⁽¹⁾

PT – Physical Therapy

OT – Occupational Therapy

GUIDELINE:

Requests for PT/OT for CTS require prior authorization and medical review. It is anticipated that the physician will provide splints, gliding exercises, and other instruction/counseling in the usual case of CTS.

Because of limited evidence supporting therapeutic activities and modalities in the comprehensive treatment of CTS, DHP will approve limited short sessions for initial evaluation and instruction in a home therapy program. ^(2, 3, 4, 7) DHP considers brief and targeted PT/OT that rapidly transitions to a robust home exercise program of benefit and considered medically necessary in the following situations: ⁽⁷⁾

- Acute or increase in pain resulting in functional impairment that is unresponsive to analgesics, ultrasound, steroids, or splinting.
- In cases where a member requires additional instruction, reinforcement, and frequent modification of a home program due to age, cognitive capacity, compliance, or exacerbations.
- Following successful and asymptomatic conservative treatment to address residual findings such as contracture
- Post-surgical rehabilitation

Driscoll Health Plan Medical Necessity Guideline

Documentation Requirements: Clinical records from the attending physician, neurologist, orthopedic surgeon, hand surgeon, or sports medicine physician clearly documenting the diagnosis, acute/chronic, related or aggravating conditions, testing to include CTS specific tests, current prior medical and surgical treatments and therapies, and the member’s response to them

BACKGROUND:

Routine Physical Therapy (PT) or Occupational Therapy (OT) has not been shown to be of benefit for the treatment of Carpal Tunnel Syndrome and may be contraindicated. Evidence-based treatment of CTS includes non-steroidal anti-inflammatories and nighttime splinting of the wrist for up to 7 weeks, followed by other conservative measures such as oral steroids, limited ultrasound, or carpal tunnel steroid injections. ⁽⁹⁾ Nerve gliding exercises – According to a Cochrane Review of exercise and mobilization interventions, there is limited and low-quality support for these exercises. ⁽⁸⁾ However, some patients benefit from exercises that help the median nerve move more freely within the confines of the carpal tunnel. ^(2, 3) Specific exercises may be recommended and demonstrated by the doctor or therapist as a component of the home program. These exercises do not require supervision by a therapist and are readily available as self-instructional handouts from sources such as the American Academy of Orthopedic surgeons. ⁽⁸⁾ Referral to Orthopedic Surgeon, Neurologist, or Physiatrist would follow if no improvement. ^(2, 3, 4, 5, 6)
